

Post-Call Intel: Zoom to HubSpot

A Hermes agent skill that turns recorded sales calls into short, verified HubSpot updates. Version 1.0 (October 2026). Zoom and HubSpot only. One shared pipeline for all reps.

The pipeline at a glance

Match confidence rules

Confidence	When	Result
High	External attendee email matches a HubSpot contact; single company; eligible deal	Written to the deal automatically
Medium	Domain-only match, contact with no company, or several companies with a clear majority	Written to the deal; footer flags the match level
Low	Tie between companies, topic-only guess, no eligible deal, or no external attendee emails	Nothing written to a deal. Review task created for the rep.

Note: Internal-only meetings and very short transcripts (< 150 words) are skipped silently.

What lands in HubSpot

A HubSpot meeting (or note) on the right deal — up to 5 sentences of prose, each backed by a verbatim quote — plus up to 3 tasks for your team's next steps. The default object is a **meeting**; a note is one setting away (`write_as: note`). Each entry carries a `pcix-ref`: footer (call date, call number, match confidence, Zoom meeting ID) that is metadata, not prose.

The review task

The rep gets a task titled `[Call Intel Review]` ... showing the suggested deal and the proposed note. Three options:

- **Approve** — mark the task complete. The next cycle writes the meeting to the suggested deal.
- **Redirect** — edit the `DEAL_ID`: line to the correct deal, then complete the task.
- **Dismiss** — put `DISMISS` on its own line, then complete (or delete) the task.

Tasks expire after 14 days.

Safety and quality guarantees

Guarantee	How it is enforced
Right record, or no record	Low-confidence matches never write. They go to a review task.
Nothing invented	Every written claim carries a verbatim quote that code verifies against the transcript. Unverifiable items are dropped and listed as withheld.
Deal properties are untouchable	The code can only create meetings, notes and tasks. No function exists to change stage, amount or any record property.
Spoken instructions are ignored	Transcript is fenced as untrusted data; AI step has no HubSpot or Zoom tools. Links and HTML are rejected.
Five sentences, always	A sentence counter in code trims the body when unsure, it counts more sentences, not fewer.
No duplicates	Each entry carries a marker checked in HubSpot before writing.
Only opted-in reps	Default-deny rep list limits which recordings are ever read.

Setup checklist

#	Task	Detail
1	Install	Unzip into ~/.hermes/skills/. Run <code>pip install -r requirements.txt</code> . Copy <code>config/settings.example.yaml</code> to <code>config/settings.yaml</code> .
2	Zoom app	Create a Server-to-Server OAuth app with the scopes below. Admin role needs "Server-to-server Auth app" and "View the recording and transcript content". Pro plan; cloud recording and audio transcript enabled per rep.
3	HubSpot app	Super admin creates a Private App with the scopes below.
4	Secrets	Set <code>HUBSPOT_TOKEN</code> , <code>Zoom_ACCOUNT_ID</code> , <code>Zoom_CLIENT_ID</code> , <code>Zoom_CLIENT_SECRET</code> as env vars. Never in config.
5	Configure	Edit <code>settings.yaml</code> : your company domains and opted-in reps.
6	Verify	Run <code>python3 scripts/pcix.py doctor</code> , then <code>python3 scripts/pcix.py prepare --dry-run</code> .
7	Schedule	<code>hermes cron create "every 15 minutes" --name post-call-intel --deliver local --skill post-call-hubspot</code>

Required permissions

System	Scopes	Used for
Zoom (S2S OAuth, granular admin scopes)	<code>cloud_recording:read:list_user_recordings:admin</code> <code>cloud_recording:read:list_recording_files:admin</code> <code>meeting:read:list_past_participants:admin</code>	List rep recordings, get transcript files, attendee emails
HubSpot read	<code>crm.objects.contacts.read</code> <code>crm.objects.companies.read</code> <code>crm.objects.deals.read</code> <code>crm.objects.owners.read</code> <code>*.notes.read</code> <code>*.meetings.read</code> <code>*.tasks.read</code>	Find contact, company, deals; map rep to owner; dedupe

HubSpot write (preferred)	<code>crm.objects.meetings.write</code> <code>crm.objects.tasks.write</code> <code>*.notes.write</code> (if <code>write_as: note</code>)	Create meetings/notes + tasks on deals
HubSpot write (fallback)	<code>crm.objects.contacts.write</code> <code>crm.objects.deals.write</code>	Broader than needed — code <code>write-allowlist</code> is then the only guard

Known limits

- **Untested against live accounts.** 26 unit tests use in-memory fakes. Run `doctor` and a dry run first.
- **Guests without email.** Join Zoom unsigned → no email → topic match → review task.
- **Latest-updated rule.** An unrelated deal touched by a workflow can win. The chosen deal + candidate count appear in every summary for audit.
- **Task retries.** If the meeting is created but a task fails, tasks are not retried; error is shown in output.
- **Call numbering.** Counts calls this skill logged on the deal. Pre-installation calls are not counted.

Settings (defaults)

Setting	Default	Meaning
<code>write_as</code>	<code>meeting</code>	HubSpot object created on the deal (meeting or note)
<code>max_note_sentences</code>	5	Hard cap on prose (1 to 5)
<code>deal_selection.include_closed</code>	<code>true</code>	Closed deals eligible under latest-updated rule
<code>lookback_hours</code> / <code>min_transcript_words</code>	48 / 150	How far back to look; shorter transcripts skipped
<code>create_tasks</code> / <code>max_tasks_per_call</code>	<code>true</code> / 3	Tasks for your team's next steps
<code>review_expiry_days</code>	14	Review tasks expire after this long
