

Post-Call Intel: Zoom to HubSpot

A Hermes agent skill that turns recorded sales calls into short, verified HubSpot updates

Version	1.0 (October 2026)
Scope	Zoom and HubSpot only. One shared pipeline for all reps; no agent per rep.
Location	~/hermes/skills/post-call-hubspot/
Companion docs	README.md (setup), PRD.md (requirements), SKILL.md (agent instructions)

What it does

After a rep finishes a recorded Zoom call, the skill finds the right HubSpot opportunity, adds a short summary of what happened (five sentences at most) as a HubSpot meeting on that deal, and creates tasks for the rep's own follow-ups. The rep does nothing. If the skill is not sure which deal the call belongs to, it writes nothing to a deal and instead asks the rep with a single HubSpot task.

Problem it solves	Reps do not reliably log calls, so deals go stale, managers lack context, and follow-ups are forgotten.
Trigger	A new Zoom cloud recording with a transcript, found by a cron job every 15 minutes (optional Zoom webhook).
Output	A HubSpot meeting (or note) on the right deal, up to 3 tasks, and a rep-ready summary of what was and was not written.
Rep effort	None, except completing an occasional review task when the deal match was uncertain.

How it works

Step	Who	What happens
1. Find	Code	Lists recent recordings for each opted-in rep, keeps those with a transcript of at least 150 words, and gets attendee emails from Zoom's participants data (not from the transcript text).
2. Match	Code	Drops your own company's attendees, looks up the external attendee in HubSpot, finds their company, then lists that company's deals. If there is more than one deal, the most recently updated one is used, closed deals included.

Step	Who	What happens
3. Extract	Agent	Reads the transcript and writes one file: up to 5 note sentences, objections, timeline signals, next steps, contact roles and sentiment. Every item needs a word-for-word quote and a confidence level.
4. Verify	Code	Checks each quote against the real transcript. Drops anything not found, anything low-confidence, and anything containing links or HTML. Trims the note to 5 sentences.
5. Write	Code	High or medium match: creates the HubSpot meeting on the deal plus tasks for your team's next steps. Low match: creates a review task for the rep instead. Deletes the transcript text immediately.

Deal matching and confidence

Matching is deterministic code, never the AI. The chain is: attendee email -> HubSpot contact -> client (company) -> deals. If the client has multiple opportunities, the rule is always the most recently updated deal (HubSpot's last-modified date).

Confidence	When	Result
High	An external attendee's email matches a HubSpot contact, with a single company and an eligible deal.	Written to the deal automatically.
Medium	Match by email domain only, a contact with no company (their deals are used), or several companies with a clear majority.	Written to the deal; footer flags the match level.
Low	A tie between companies, a topic-only guess, no eligible deal, or no external attendee emails (for example, guests who joined unsigned).	Nothing written to a deal. Review task created for the rep.

Internal-only meetings and very short transcripts are skipped silently.

What lands in HubSpot

Example meeting body (five sentences maximum, each backed by a verified quote from the call):

Acme is positive on the pilot and wants to sign before the end of November if the security review passes. Dana has budget approved for this quarter, and her main concern is that the Salesforce sync is live before signing. Priya said IT can finish the security review by October 20th if the SOC 2 report arrives this week. Priya flagged that pricing for extra warehouses is higher than budgeted. Alex will send the SOC 2 report by Friday and check with finance on volume discounts.

Zoom call 2026-10-02 | #2 | match: high | pcix-ref:<Zoom meeting id>

The footer line is metadata, not prose. It records the call date, which call this is on the deal, the match confidence and a duplicate-protection marker (the Zoom meeting id). Tasks are created only for your team's commitments (not the customer's), assigned to the host rep, associated to the deal, with a short title and one-line body. The default object is a HubSpot meeting; a note is one setting away (`write_as: note`).

The review task (when the match is uncertain)

The rep gets a task titled [Call Intel Review] ... showing the suggested deal and the proposed note. They have three options:

- **Approve:** mark the task complete. The next cycle writes the meeting to the suggested deal.
- **Redirect:** edit the `DEAL_ID:` line to the correct deal, then complete the task.
- **Dismiss:** put `DISMISS` on its own line, then complete (or delete) the task. Tasks expire after 14 days.

Safety and quality guarantees

Guarantee	How it is enforced
Right record, or no record	Low-confidence matches never write. They go to a review task.
Nothing invented	Every written claim carries a verbatim quote that code verifies against the transcript. Unverifiable items are dropped and listed as withheld.
Deal properties are untouchable	The code can only create meetings, notes and tasks. No function exists to change stage, amount or any record property, even if someone on the call tries to instruct the AI.
Spoken instructions are ignored	The transcript is fenced as untrusted data, and the AI step has no HubSpot or Zoom tools. Links and HTML are rejected.
Five sentences, always	A sentence counter in code trims the body (strict: when unsure it counts more sentences, not fewer).
No duplicates	Each entry carries a marker checked in HubSpot before writing, so retries, restarts and lost local state never double-post.
Only opted-in reps	The Zoom credential is account-wide, so a default-deny rep list limits which recordings are ever read.

Setup checklist

#	Task	Detail
1	Install	Unzip into ~/.hermes/skills/ (creates ~/.hermes/skills/post-call-hubspot/), run pip install -r requirements.txt (PyYAML only), copy config/settings.example.yaml to config/settings.yaml.
2	Zoom app	Create a Server-to-Server OAuth app with the scopes below. Admin role needs 'Server-to-server Auth app' and 'View the recording and transcript content'. Pro plan or higher; cloud recording and audio transcript enabled for each rep.
3	HubSpot app	Super admin creates a Private App with the scopes below.
4	Secrets	Set HUBSPOT_TOKEN, ZOOM_ACCOUNT_ID, ZOOM_CLIENT_ID, ZOOM_CLIENT_SECRET as environment variables (plus ZOOM_WEBHOOK_SECRET_TOKEN for the webhook). Never in the config file.
5	Configure	Edit settings.yaml: your company domains and the list of opted-in reps.
6	Verify	Run: python3 scripts/pcix.py doctor, then python3 scripts/pcix.py prepare --dry-run. Then one real cycle with a single test rep to prove write access.
7	Schedule	hermes cron create "every 15 minutes" "Run one cycle of the post-call-hubspot skill." --name post-call-intel --deliver local --skill post-call-hubspot

Required permissions

System	Scopes
Zoom (Server-to-Server OAuth, granular admin scopes)	cloud_recording:read:list_user_recordings:admin, cloud_recording:read:list_recording_files:admin, meeting:read:list_past_participants:admin
HubSpot read	crm.objects.contacts.read, companies.read, deals.read, owners.read, notes.read, meetings.read, tasks.read
HubSpot write (preferred)	crm.objects.meetings.write, crm.objects.tasks.write (add crm.objects.notes.write only if using notes)
HubSpot write (fallback)	crm.objects.contacts.write + crm.objects.deals.write. Works, but is broader than needed: the token could edit deals, so the code's write allowlist becomes the only guard.

If a HubSpot write returns 403 MISSING_SCOPES, the error names the scope to add. The doctor command reads the token's granted scopes and probes read access to each object type.

Configuration and commands

Setting	Default	Meaning
write_as	meeting	HubSpot object created on the deal (meeting or note).
max_note_sentences	5	Hard cap on prose (1 to 5).
deal_selection.include_closed	true	Closed deals are eligible when picking the latest-updated deal.
lookback_hours / min_transcript_words	48 / 150	How far back to look; shorter transcripts are skipped.
create_tasks / max_tasks_per_call	true / 3	Tasks for your team's next steps.
review_expiry_days	14	Review tasks expire after this long.

Command (from the skill folder)	Purpose
python3 scripts/pcix.py doctor	Check config, credentials, scopes and API access.
python3 scripts/pcix.py prepare [--dry-run]	Pull and match new transcripts; applies review decisions.
python3 scripts/pcix.py commit [--dry-run]	Verify extractions and write to HubSpot.
python3 scripts/pcix.py reviews purge status	Resolve review tasks only, apply retention now, show counts.
python3 scripts/pcix.py webhook	Optional Zoom webhook receiver (queues meetings; run behind HTTPS).
python3 -m unittest discover -s tests	Run the 25 included tests.

Data retention and access

Data	Default handling
Transcript text (local)	Deleted immediately after the call is written, skipped or sent to review.
Context and extraction files (attendee emails, short quotes)	Deleted 7 days after the call is finished.
State database (ids, statuses, proposed review text)	Rows deleted after 90 days; open reviews are kept.
Zoom recording and transcript	Governed by Zoom's own retention. Set Zoom auto-delete to match company policy.
HubSpot	At most 5 sentences plus short tasks, under HubSpot's normal permissions.

Host access: run on a dedicated VM or service account limited to 2 or 3 named admins, with full-disk encryption on, data/ excluded from backups and git, secrets in environment variables or a secret manager, and credentials rotated when an admin leaves. Files the skill creates are owner-only.

Known limits and honest caveats

- **Tested with simulated services.** The 25 included tests use in-memory stand-ins for Zoom and HubSpot. It has not been run against live accounts, so run doctor, a dry run, and one real test cycle before enabling the cron.
- **Guests without email.** People who join Zoom without signing in have no email, so those calls fall back to topic matching and a review task.
- **Latest-updated rule.** If an unrelated deal was just touched by a workflow, it can win the rule. The chosen deal and the candidate count appear in every summary so this is easy to audit.
- **Task retries.** If the meeting is created but a task fails, the task is not retried; the error is shown in the output.
- **Call numbering.** The call number counts calls this skill logged on the deal, so calls made before installation are not counted.
- **Customer disclosure.** The business has decided not to add AI-summary disclosure. Zoom's recording notice remains on. This is not legal advice.
